Advanced Property validation rule configuration

Advanced Rule Configuration · https://extensionkit.unitfly.com/documentation/advanced-property-validation-rule-configuration/

Upon switching to advanced configuration mode within the Property validation rule configuration, additional options become available:

- Alias
- Value from
- Referenced object
- Custom error message
- Business critical

Alias

Assign a unique rule alias for easy identification.

Value from

Specifies the option for searching the value. Choose one of the following options:

- **Source** (default): Searches for the value from the trigger source.
- **Vault Search**: Searches the vault.
- **Specify:** Specifies where to get the value from. If selected, additional fields are available: **Static search filters for Value from, Dynamic search filters for Value from, Search results sort, Exclude source from search results**.

Referenced object

Property validation rules > Property validation rule [1] > Referenced object

Displayed only if Configuration mode within the Property validation rule is set to Advanced.

Use this option when the property to be validated is not located directly on the source object but on a referenced object. Enter a property expression that points from the trigger source or vault search to the referenced object that contains the property to validate.

Custom error message

Property validation rules > Property validation rule [1] > Custom error message

Displayed only if Configuration mode within the Property validation rule is set to Advanced.

Optional custom error message.

Business critical

If set to true, the rule will be logged in SEQ.

- **No (default)**
- **Yes**
